

## Reveal Sheet - Session 12 Dossier D / Tool-Using Artificial Agent

PRI is  $.81[.75, .87]$ . The index detects a complex perturbational response. State reset demonstrates some internal role, but scheduler and human selection dominate long-horizon behavior. No artificial-domain calibration exists and the biological source threshold was copied. A short-horizon candidate is plausible; the long-horizon boundary is indeterminate.

$V, N_1, N_2, N_3$  and the long-horizon boundary remain unassessed.
